

Proportional-differential regulator ...

S/103/63/024/002/010/020
D201/D308

the value of the ampere-turns applied to the input terminals. The parameters of an experimental regulator utilizing the above principle were as follows: 1) inactive zone with respect to input current - 8 mA; 2) input resistance - 350 ohms; 3) output power - 14 W, with optimum d.c. load of 36 ohms; 4) non-controllable duration of output pulse, with the magnetic relay 'closed' - 0.018 sec; 5) controllable output pulse duration with the relay 'open' depends on the magnitude of input signal and on the time constant T which may be continuously varied from 5 to 200 sec. The type described can be used for designing highly reliable and economical proportional-integral regulators with independent adjustment of parameters. There are 5 figures and 1 table. ✓

TITLE: Improving demodulators

SOURCE: Avtomatika i telemekhanika, v. 25, no. 3, 1964, 416-423

TOPIC TAGS: demodulator, halfwave demodulator, semiconductor diode demodulator, balanced demodulator

ABSTRACT: The performance of a phase-sensitive half-wave semiconductor-diode demodulator depends on the initial unbalance, linearity of its modulation characteristic, transconductance, input and output impedances, operating stability, complexity and reliability of the device. Formulas and graphs are developed for determining the forward and reverse unbalances of the demodulator. The reverse unbalance may be considerably reduced by the proper selection of the load impedance; recommended values for DGTs 21-27 Ge diodes and D 201-205 Si

Card 1/2

ACCESSION NR: AP4033364

diodes are given. To reduce the forward unbalance, the introduction of series resistors is recommended. The residual forward unbalance can be reduced by a balanced circuit which permits an adjustment of the supply voltages applied to the demodulator arms. Orig. art. has: 5 figures and 22 formulas.

TITLE: Contactless device for pulse-duration modulation intended for discrete automatic-control systems

SOURCE: Avtomatika i telemekhanika, v. 26, no. 1, 1965, 162-167

TOPIC TAGS: pulse duration modulation, automatic control, automatic control design, automatic control system, automatic control theory

ABSTRACT: The development of a new contactless pulse-duration modulator (PDM) is reported. Intended for converting a slow-varying signal into a sequence of PD-modulated variable-repetition-frequency pulses, the FDM comprises a linear time modulator and a control unit, both designed with electron tubes. These technical data are claimed: sensitivity, 0.5 v; maximum input signal amplitude, ± 30 v; linear modulation with a pulse duration within 0.3-0.6 seconds

Card 1/2

L 32018-65

ACCESSION NR: AP5003980

(this range can be shifted); output-pulse constant amplitude, ± 50 v. The FDM is also suitable for pulse-time conversions and for simulating certain discrete automatic-control systems. Orig. art. has: 3 figures.

TITLE: A hydrostatic clamp. Class 47, No. 176763

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 23, 1965, 75

TOPIC TAGS: hydraulic device, hydrostatic extrusion, explosive forming

ABSTRACT: This Author Certificate presents a hydrostatic clamp for stock in an assembly used for hydroexplosive shaping. The unit includes tapered linings mounted on the clamping circle, a cylinder with a piston mounted under the die, and a tubular shaft with a plunger concentrically positioned in respect to the cylinder (see Fig. 1). The design creates a closed system which permits the use of the clamp without the application of a constant source of pressure in the forming process. The piston is spring loaded, and the plunger is connected with a rod which moves out from the cylinder. This rod, after the application of pressure (for example, from a transportable pneumatic cylinder) is fixed in a specified position with the help of an adapter, regulating collar, washer, and nut.

"Locally Nilpotent Groups Without Torsion," N. F. Sesekin, Sverdlovsk

"Matemat Sbornik" Vol 32 (74), No 2, pp 407-442

A study of properties of a locally nilpotent group which possesses even a single maximal Abelian subgroup of finite rank, including an investigation of conditions that are sufficient for finiteness of rank, and consequently nilpotency, of locally nilpotent groups. An example is given of torsionless groups of class $w+1$ possessing maximal abelian subgroup of rank 3; also an example of a group without twisting or center which is covered by nilpotent normal divisors.

TITLE: On a Class of Two-Stage Groups (Ob odnom klasse dvustupennykh grupp)

PERIODICAL: Matematicheskiy sbornik, 1958, Vol 46, Nr 2, pp 133-142 (USSR)

ABSTRACT: The authors investigate non-abelian groups different from their commutator group, and all the normal divisors of which are commutative (Be-groups). If the factor group with respect to the commutator group of the Be-group is primary cyclic, then the Be-group is called a Be_1 -group. If the factor group is a direct product of two primary cyclic groups, then the initial group is called a Be_2 -group.

Theorem: In order that G is a Be_2 -group it is necessary and sufficient that G is a finite p -group, the commutator group K of which is cyclic and of prime order p , where G/K is the direct product of two primary cyclic groups; furthermore G has to possess a center Z so that G/Z is the direct product of two cyclic groups of p -th order.

Theorem: G is a Be_1 -group then and only then if G/K is a cyclic group, the order of which is a power of a prime number p , and if G has an abelian subgroup M containing K and having the index p .

Study of Properties of Sheepskins Used for Imitation of Coypu Fur.
Anuarul. lucr. stiint., Inst. Agron., 1957, 335-349.

Abstract: The properties of skins of adult lambs with fine or semifine wool (18 to 34) were studied; imitated coypu fur ("Nutriet") is produced of these skins after processing them by tanning, combing, clipping, dyeing and smoothing. 80 lamb skins of the improved sheep breed "Spanka" were studied with a view to improve the quality of the raw material for manufacturing high quality "Nutriet". The lambs are slaughtered 5 1/2 to 6 1/2 months old, when they weigh not less than 26 kg having been fed well above the Normal. It is shown that the breeding and selection of sheep should be carried out taking into consideration the following specified mean qualitative indices in order to avoid any losses in the wool production and of mean and milk; wool thickness - 18 to 26, wool density - 4000 to 5000 fiber per sq.cm.; the uniformity and elasticity of wool and skin, as well as the satinity and lustry of wool must be good, wool strength, 9.36 - 0.16 g; elongation - 36-8 -0.18% derma thickness 2,32 mm; -70 squareinches. Grading of the studied skins of sheep of the improved breed "Spanka" after their processing resulted in 57.5% of I class skins, 37.5% of II class skins, 3.8% of III class skins and 1.2% of scrap.

Industrial Experiment in Replacing Sodiumsulphate by Astrachanite in the Melting of Glass (Promysliennyy opyt zameny sul'fata natriya astrakhanitom pri varke stekla)

PERIODICAL:

Steklo i keramika, 1958, Nr 8, pp. 3 - 5 (USSR)

ABSTRACT:

The possibilities of using astrachanite in the melting of glass were investigated at the Institute of Glass (Institut stekla) by S. Ya. Raf in 1940 - 1953, as well as at the Belorussian Polytechnical Institute (Belorusskiy politekhnicheskiy institut) by A. A. Gezburg in 1941. Besides, the All-Union Institute of Halurgy (Vsesoyuznyy institut galurgii) carried out investigations on the working up of astrachanite from 1947 to 1954. The great attention which was attracted by this mineral may be explained by the fact that huge deposits may be found in the area of the Aral and Caspian Seas (Aral'skoye i Kaspiyskoye morya), the lower Volga (Nizhnyaya Volga) and at a number of other places. The fol-

Card 1/3

SOV/72-58-8-2/17

Following formula holds for the composition of astrachanite:
 $A = 278x / (100 + B)$, where x denotes the percentage of $MgSO_4$ and B the percentage of H_2O . Earlier papers showed that astrachanite may be used only after its homogeneity had been improved (Ref 1). At the end of 1954 a working team of the Institute of Glass together with the collective of the Krasnoud'sk glass factory carried out a continuous experiment of glass melting in a tank furnace with astrachanite. More than 400 t of this mineral were used. Its chemical composition and the sample taking are given and described. Its working up was carried out according to scheme (Fig), and this process is then described in detail. By the introduction of astrachanite into the charge the properties of glass melting are not changed. The comparative data concerning work may be seen from Table 2. I. G. Drushinin (Ref 2) showed in his paper that astrachanite melts at a temperature of 670° .

Conclusions:

- 1) Astrachanite may be used to replace sodiumsulfate.
- 2) This increases a little the costs of the charge.
- 3) To use this material successfully a respective preparation must be organized at its place of finding.

Editorial Board: A.I. Avgustinik, V.P. Boronkovskiy, M.A. Ezorobolov, O.K. Kovtalin, V.V. Vargin, A.G. Vlasov, K.S. Kostroplyev, A.A. Lebsiev, N.A. Matveyev, V.S. Molchanov, R.L. Kyuller, Ye.A. Poryoz-Koshits, Chai-zan, R.A. Toropov, V.A. Florinskaya, A.K. Yuzhinskiy; Ed. of Publishing House: I.V. Suvorov; Tech. Ed.: V.T. Bochever.

PURPOSE: This book is intended for researchers in the science and technology of glasses.

CONTENTS: The book contains the reports and discussions of the Third All-Union Conference on the Vitreous State, held in Leningrad on November 16-19, 1959. They deal with the methods and results of study of the structure of glasses, the relation between the structure and properties of glasses, the nature of the chemical bond and glass structure, and the physicochemicality of glass. Fused silicas, mechanics of vitrification, optical properties and glass structure, and the electrical properties of glasses are also discussed. A number of the reports deal with the dependence of glass properties on composition, the tinting of glasses and radiation effects, and mechanical, technical, and chemical properties of glasses. Other papers treat glass semiconductors and such borosilicate glasses. The Conference was attended by more than 300 delegates from Soviet and East German scientific organizations. Among the participants in the discussion were R.V. Solov'ev, Ye. V. Korshakovskiy, Yu.A. Gastev, V.P. Pryanishnikov, Yu. Ye. Gotlib, O.P. Mchedlov-Petrovskiy, G.P. Mikhaylov, S.M. Petrov, A.M. Lazarev, D.I. Levin, A.V. Shatilov, M.F. Florkhinskiy, A.Ya. Kuznetsov, E.Y. Degtyarova, G.V. Byrgunovskaya, A.A. Malenkov, N.S. Savel'evich, Z.G. Plinker, and O.S. Holchunova. The final session of the Conference was addressed by Professor I.I. Mikhogorodskiy, Honored Scientist and Engineer, Doctor of Technical Sciences. The following Institutes were cited for their contribution to the development of glass science and technology: Gosudarstvennyy opticheskii institut (State Optical Institute), Institut khimii silikatov AN SSSR (Institute of Silicate Chemistry, AS USSR), Fizicheskii institut AN SSSR (Physics Institute AS USSR), Fiziko-khicheskii institut AN SSSR (Physicochemical Institute AS USSR), Institut fiziki AN SSSR (Institute of Physics AS USSR), Belorusskiy nauchnoissledovatel'skiy tsentr (Belorussian Scientific Center), Minsk (Institute of Physics of the Institute obshchey i neorganicheskoy khimii AN SSSR, Minsk (Institute of General and Inorganic Chemistry, Academy of Sciences, Belorussian SSR, Minsk), Institut vysokomolekulyarnykh soedineniy AN SSSR (Institute of High Molecular Compounds, AS USSR), Gosudarstvennyy institut stekla (State Institute for Glass), Gosudarstvennyy institut elektrotexnologiya (State Institute for Electrical Glass), Sibirskiy fiziko-khicheskii institut, Tomsk (Siberian Physicochemical Institute, Tomsk), Leningradskiy gosudarstvennyy universitet (Leningrad State University), Moskovskiy khimiko-tekhnologicheskii institut (Moscow Institute of Chemical Technology), Leningradskiy tekhnologicheskii institut im. Lensovetu (Leningrad Technological Institute named after Lensoveta), Belorusskiy politekhnicheskii institut Minsk (Belorussian Polytechnic Institute, Minsk), Kovnerkasskiy politekhnicheskii institut (Kovnerkasskiy Polytechnic Institute), and Sverdlovskiy politekhnicheskii institut (Sverdlovsk Polytechnic Institute). The Conference was sponsored by the Institute of Silicate Chemistry AS USSR (Acting Director - A.S. Gotlib), the Vsesoyuznoye khimicheskoye obshchestvo im. D.I. Mendeleeva (All-Union Chemical Society named D.I. Mendeleev), and the Gosudarstvennyy ordena Lenina opticheskii institut imeni S.I. Vavilova (State Order of Lenin Optical Institute named S.I. Vavilov). The 15 resolutions of the Conference include recommendations to organize a Center for the purpose of the coordinating the research on glass, to publish a new periodical under the title "Fizika i khimiya stekla" (Physics and Chemistry of Glass), and to join the International Committee on Glass. The Conference was attended by A.A. Lebsiev, Academician, Professor, and Chairman of the Organization of Chemists; Ye.A. Poryoz-Koshits, Professor, and Chairman of the Organizational Committee; and R.L. Kyuller, Doctor of Chemical Sciences, Member of the Organizational Committee. The editorial board thanks D.M. Burtinov, M.V. Vol'kenskiy, L.I. Bemina, D.P. Dobyshin, B.K. Dubrov, V.A. Ioffe, and B.T. Kholmlyats. References accompany individual reports.

Magnetic properties as a means of studying metals and alloys. Bohdan Šesták and Ladislav Jeníček (Kladno, Czech.). *Hutnické Listy* 3, 185-82(1950).—A description is given of the influences on the ferromagnetic properties of metals and alloys of the temp., compn., change of phase, and structure, and of the methods and instruments used for investigating these influences. Particular attention is given to the magnetic balance and induction instruments used for investigating the isothermic breakdown of austenite and of the residual austenite, the detn. of the magnetic anisotropy, and the classification of steels on the basis of differences in their magnetic properties. Since all the enumerated factors influence the magnetic properties simultaneously, it is not possible to say conclusively which of the factors is responsible for a change in the magnetic properties of the analyzed specimen. Therefore these methods are mainly used for comparison with a standard.

CZECH/37-59-1-13/26

TITLE: On the Mechanism of Making Dislocations^b Visible at the Surface of Crystals of Iron by Anodic Dissolution

PERIODICAL: Československý Časopis Pro Fysiku, 1959, Nr 1, pp 86-93 + 2 plates

ABSTRACT: Several authors have shown that dislocations can be observed by electro-polishing (Refs 7-12). None of these papers have described the mechanism of this process. The present paper is based on a previous paper by the author (Ref 11). A crystal of iron containing 3.2-4.5% of Si and approximately 0.01% of carbon was used. The crystal was annealed at 1350 °C in pure dry hydrogen for 20 hours. The crystal was cut and the samples ground so that surfaces parallel to within 1° with (100), (110), (111), and (112) planes were obtained. Three randomly orientated samples were also prepared. Contrary to the case of germanium (Ref 13), dislocations can be etched on all the surfaces by the same method (Ref 11), (electro-polishing in a mixture of ortho-phosphoric acid, chromium oxide and water). Some of the samples were decarbonised by annealing them for 50 hours in wet

On the Mechanism of Making Dislocations Visible at the Surface of Crystals of Iron by Anodic Dissolution

hydrogen at 1000 °C and for a further 50 hours in dry hydrogen at the same temperature. On such decarbonised samples, dislocation pits cannot be etched. We concluded that etching occurs in our case by the preferential dissolution of carbides which have been precipitated along dislocation lines and does not readily occur if carbon is not present. In order to obtain further insight into the mechanism of electro-polishing, we measured the electrode potential of the sample as a function of the current density. The electrolyte consisted of: 80 parts H_2PO_4 ; 13 parts CrO_3 ; and 7 parts of water. The anodic polarisation curves are shown in Fig 2 (p 116a). The potential was steadily increased by 0.5 V/min. Curve 1 was registered while the electrolyte was constantly stirred, curve 2 was taken without stirring and curve 3 during continuous decrease in the voltage. Fig 3b shows the polarisation curves in the region of current densities in which etching of dislocations occurs. The sample contained 3.5% Si. The potential is given in volts of the hydrogen scale.
